n/a non-GMO

Test Comments: The early-season test has highly variable results due to changing soil types, wildlife damage and sprayer tracks. Both tests had variable harvest grain moistures and was some of the wettest grain I've seen this year. The full-season test had a couple of plots with grain moistures over 30 percent. The full-season test had more uniform results despite wet grain. Early test rejected for variable results.

† See last page for footnote information. Dark colored row identifies the check product found in early- and full-season tests. **Bold** yields are significantly above test average. **Italicized** brands exceed the grain moisture limit for this test. **GC** = grower comparison product, **ns** = not significantly different
