### TEST COMMENTS:

Planting conditions were good in the area this year, however freezing temperatures on May 11 did leave soils cold for a bit and caused some delay in emergence until heat came back. The biggest setback for yields in this area was the D2 (severe) drought conditions that persisted all season and still exists at harvest. Areas of this Dinsdale silty clay loam revealed dry pockets within the trial site where moisture was depleted deep into the soil profile, resulting in stunted plants with small ears which also led to some variability across reps. A few big showers finally came at the end of August and left a 6.4" surplus for the month. While the moisture helped fill kernels, the damage from previous dry conditions had already been done. Results not reported due to yield variability from drought stress.
