### TEST COMMENTS:

Soil conditions were quite good at planting. Rains fell often from mid-April through mid-July. Leon summarized monthly rainfalls as April = OK; May = ridiculous; June = preposterous; July = Please Stop!; August = good. Variable yields across southern MN were closely related to field elevation and how much water was retained in individual fields. Way too much rain for about 10 weeks in most of southern MN. Leon noted very little IDC due to the heavy rains denitrifying and leaching nitrates from the soil. Bean plants grew very slowly until July, then canopied quite well by August. Aphids were sprayed at threshold levels but they did not limit yields much. Lower-yielding fields generally showed smaller seed sizes at maturity. One replicate was removed due to higher yield variation from saturated soils.
